International application No. PCT/CN2005/000087

Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; Box No. V citations and explanations supporting such statement 1. Statement: Novelty (N) Claims 1-24 YES Claims NO Inventive step (IS) Claims 1-24 YES Claims NO Industrial applicability (IA) Claims 1-24 YES Claims NO

2. Citations and explanations (Rule 70.7)

1. Cited documents:

D1: US6103947A(See the whole document, especially the example 1)

2. Novelty

Claim 1 claims a solid acid catalytic process for alkylating aromatic hydrocarbons or isomeric paraffin with olefin, which features that the solid acid catalyst contracts with hydrogen halide before it contacts with the raw materials mixture composed of aromatic hydrocarbons or isomeric paraffin, monoolefins and a compound containing strong electrically negative element as

None of the prior art disclosed or taught the processes of claims 1. Accordingly, the subject-matter of claim 1 is considered to be novel, that is, it is considered to meet the requirement of Article 33(2)PCT.

Based on the same reason, the dependent claims 2-24 are also considered to meet the requirement of Article 33(2)PCT.

3. Inventive steps

It seems that D1 is the most relevant document.

D1 disclosed an alkylating process of isomeric paraffin and olefin(pls see the example 1), which includes the following steps: 1) the solid acid catalyst loaded in the reactor was flushed with liquid isobutane containing 1000ppm chloride as sec-butyl chloride, 2) after completion of the flush, a feedstock containing isobutane, butene, and sec-butyl chloride was cut into the plant to perform the alkylation reaction;

The difference between D1 and claim 1 is that, in D1, the catalyst contacts with sec-butyl chloride before the alkylation, but in claim 1, it contacts with hydrogen halide before the alkylation;

Because Paul T. Barger etal. doesn't explain why to flush the catalyst with isobutane containing sec-butyl chloride, it is not evident for the skilled in the art to contact the catalyst with hydrogen halide before the alkylation reaction to improve the sectivity of the products such as TMP and to improve the stabity of the catalyst.

Accordingly, the subject-matter of claim 1 is considered to involve inventive steps, that is, it fullfils the requirement of Article 33(3) PCT.

Based on the same reasons, the subject-matters of dependent claims 2-24 also fullfil the requirement of Article 33(3) PCT.

3. Claims 1-24 are considered to be industry applicable.
